Introduction to Programming and Object-Oriented Design

Basics of machine, software, and program design
Computer Organization

- Every computer is organized roughly into four parts
  - **CPU - central processing unit**
    - Where decisions are made, computations are performed, and input/output requests are delegated
  - **Memory**
    - Stores information being processed by the CPU
  - **Input devices**
    - Allows people to supply information to computers
  - **Output devices**
    - Allows people to receive information from computers

CPU

- “Brains” of the computer
  - Arithmetic calculations are performed using the Arithmetic/Logical Unit or ALU
  - Control unit decodes and executes instructions
- Arithmetic operations are performed using binary number system
CPU

- Fundamental building block is a switch
  - Switches are made from ultrasmall transistors
- Example -- Pentium II
Binary Arithmetic

- The individual digits of a binary number are referred to as bits
  - Each bit represents a power of two
- Examples

\[
01011 = 0 \cdot 2^4 + 1 \cdot 2^3 + 0 \cdot 2^2 + 1 \cdot 2^1 + 1 \cdot 2^0 = 11
\]

\[
00010 = 0 \cdot 2^4 + 0 \cdot 2^3 + 0 \cdot 2^2 + 1 \cdot 2^1 + 0 \cdot 2^0 = 2
\]

Binary addition

\[
\begin{array}{c}
\text{(Binary)} \\
00010 \\
+ 01011 \\
\hline
01101 \\
\end{array}
\]

Equivalent decimal addition

\[
\begin{array}{c}
\text{(Decimal)} \\
2 \\
+ 11 \\
\hline
13 \\
\end{array}
\]
Binary Arithmetic

Binary multiplication

\[
\begin{array}{c}
  \text{0101} \\
  \times \text{0011} \\
  \hline \\
  \text{0101} \\
  \text{0101} \\
  \text{0000} \\
  \hline \\
  \text{0001111}
\end{array}
\]

Equivalent decimal multiplication

\[
\begin{array}{c}
  \text{5} \\
  \times \text{3} \\
  \hline \\
  \text{15}
\end{array}
\]
Two’s Complement

- Convention for handling signed numbers in binary representation
  - The leading bit is a sign bit
    - Binary number with leading 0 is positive
    - Binary number with leading 1 is negative
- Magnitude of positive numbers is just the binary representation
- Magnitude of negative numbers is found by performing the two’s complement
  - Complement the bits
    - Replace all the 1's with 0's, and all the 0's with 1's
  - Add one to the complemented number
- Carry in most significant bit position is thrown away when performing arithmetic
Two's Complement Example

- Performing two's complement on the decimal 7 to get -7
  - Using a five-bit representation

\[
\begin{align*}
7 & = 00111 \text{ Convert to binary} \\
11000 & \text{ Complement the bits} \\
11000 + 00001 & = 11001 \text{ Is -7 in two's complement}
\end{align*}
\]
Two's Complement Arithmetic

- Computing $8 - 7$ using a two's complement representation with five-bit numbers

$$8 - 7 = 8 + (-7) = 1$$

- $01000$ Two's complement of $8$
- $11001$ Two's complement of $-7$

Throw away the high-order carry as we are using a five bit representation

Add $8$ and $-7$

$$\begin{align*}
01000 & \\ + 11001 & \\
\hline
100001 & \\
\hline
00001 & \text{Is the five-bit result}
\end{align*}$$
Control Unit

- The fetch/execute cycle is the steps the CPU takes to execute an instruction
- Performing the action specified by an instruction is known as “executing the instruction”
- The program counter (PC) holds the memory address of the next instruction

1. Fetch the instruction to which the PC points
2. Increment the PC
3. Execute the fetched instruction

Engineering Software

● Software engineering
  ■ Area of computer science concerned with building large software systems

● Challenge
  ■ Tremendous advances in hardware have not been accompanied by comparable advances in software
System complexity tends to grow as the system becomes more user friendly.
Software Engineering Goals

- Reliability
  - An unreliable life-critical system can be fatal
- Understandability
  - Future development becomes very difficult if software is hard to understand
- Cost Effectiveness
  - Cost to develop and maintain should not exceed profit
- Adaptability
  - System that is adaptive is easier to alter and expand
- Reusability
  - Improves reliability and maintainability, and reduces development costs
Software Engineering Principles

- **Abstraction**
  - Extract the relevant properties of an object while ignoring inessential details

- **Encapsulation**
  - Breaking down an object into parts, hiding and protecting its essential information, and supplying an interface to modify the information in a controlled and useful manner

- **Modularity**
  - Dividing an object into smaller pieces or modules such that the object is easier to understand and manipulate

- **Hierarchy**
  - Ranking or ordering of objects based on some relationship between them
Abstraction

- Process of extracting only the relevant properties of an object
- Extracted properties define a view of the object
- Example
  - Car dealer views a car from selling features standpoint
    - E.g., price, length of warranty, color, optional equipment
  - Mechanic views a car from systems maintenance standpoint
    - E.g., type of oil, size of the oil filter, type of spark plugs

Price? Oil change?
Encapsulation

- Breaking down an object into parts, hiding and protecting its essential information, and supplying an interface to modify the information in a controlled and useful manner.
- By hiding the information its representation and content can be changed without affecting other parts of the system.
- Example - car radio
  - Interface consists of the controls and types of connectors for connecting the radio to the car.
  - The details of how it works is hidden.
  - To install and use a radio, we do not need to know anything about the radio’s electrical system.
Modularity

- Dividing an object into smaller pieces or modules such that the modules hold useful information and the object is easier to understand and manipulate
- Most complex systems are modular
- Example - Automobile can be decomposed into subsystems
  - Cooling system
    - Radiator
    - Thermostat
    - Water pump
  - Ignition system
    - Battery
    - Starter
    - Spark plugs
Hierarchy

- Ranking or ordering of objects based on some relationship between them
- Hierarchies help us understand complex systems
  - Example - a company hierarchy helps employees understand the company and their positions within it
- For complex systems, a useful way of ordering similar abstractions is from least general to most general
  - Scientists use this technique to identify and classify species
- Hierarchical ordering based on natural relationships is called a taxonomy

Object-oriented (OO) design and programming is a methodology that supports good software engineering.

Object-oriented design promotes thinking about software in a way that models the way we think and interact with the real world.

Example - watching television:

- The remote is a physical object with properties:
  - Weight, size, can send messages to the television.
- The television is also a physical object with various properties.
Objects

- An object is almost anything that can be attributed with the following characteristics
  - Name
  - Properties
  - The ability to act upon receiving a message
    - Basic message types
      - Directive to perform an action
      - Request to change one of its properties
Object-Oriented Programming

● Example
  ■ Sketch the design of a simple computer game called Bug Hunt
    – Goal of game is to eliminate the bugs on the screen
  ■ Features of game
    – A moving bug is displayed in a window on the screen
    – The bug changes directions randomly
    – A bug is eliminated by “swatting” it several times
    – If a bug is eliminated, a faster one pops up
    – If an attempted swat misses the bug, the game ends
Object-Oriented Programming

- First step
  - Determine the objects
    - Mouse
    - Window
    - Bug
Bug Hunt

- To implement Bug Hunt, a bug needs the following properties
  - Position in the window
  - A display image or picture
  - Current speed
  - Current direction
  - Strength (the number of swats it takes to eliminate the bug)
Bug Hunt

- A bug needs to handle the following messages
  - Draw
  - Move
  - Change direction
  - Hit
